national parks. The plans are directly linked to the groundbreaking research in the National Ecosystem Assessment that showed the strong economic arguments for safeguarding and enhancing the natural environment. They also act on the recommendations of 'Making Space for Nature', a report into the state of England's wildlife sites, led by Professor John Lawton and published in September 2010, which showed that England's wildlife sites are fragmented and not able to respond to the pressures of climate change and other pressures we put on our land. Key measures proposed include: i) Reconnecting nature with New Nature Improvement Areas (NIAs) with a £7.5 million fund for 12 initial NIAs, biodiversity offsetting, New Local Nature Partnerships with £1 million available this year, phasing out peat, ii) Connecting people and nature for better quality of life with Green Areas Designation, better urban green spaces; more children experiencing nature by learning outdoors, strengthening local public health activities, the new environmental volunteering initiative "Muck in 4 Life" to improve places in towns and countryside for people and nature to enjoy and iii) Capturing and improving the value of nature with a Natural Capital Committee; an annual statement of green

accounts for UK Plc, a business-led Task Force to expand the UK business opportunities from new products and services which are good for the economy and nature alike. A significant contribution to the field, and a welcome addition to the growing literature on international environmental law and an important reference for every scholar, lawyer, and layperson interested in the field. This handbook is an advanced level reference guide which provides a comprehensive and contemporary overview of the corpus of international environmental law (IEL). This is the third edition of this publication which contains the latest information on vaccines and vaccination procedures for all the vaccine preventable infectious diseases that may occur in the UK or in travellers going outside of the UK, particularly those immunisations that comprise the routine immunisation programme for all children from birth to adolescence. It is divided into two sections: the first section covers principles, practices and procedures, including issues of consent, contraindications, storage, distribution and disposal of vaccines, surveillance and monitoring, and the Vaccine Damage Payment Scheme; the second section covers the range of different diseases and vaccines. A detailed

overview of the law-and-economics methodology developed and employed by environmental lawyers and policymakers. This PPG provides a full statement of Government policies for the identification and protection of historic buildings, conservation areas, and other elements of the historic environment. It explains the role played by the planning system in their protection, and complements the guidance on archaeology and planning given in PPG 16. Environmental Law: Text, Cases, and Materials has been designed to provide students with everything they need to approach the subject with confidence. Experts in the area, the authors combine clear and insightful commentary with carefully chosen extracts from UK and international sources to offer students a well-rounded view of the subject area. Covering a broad range of topics, the authors introduce discussion on controversies and debates and encourage readers to engage in critical reflection by posing regular discussion questions throughout the text. Further reading suggestions point students towards useful resources, guiding their independent research. Online Resources This book is also accompanied by online updates collated by the authors, helping students to stay well-

informed. This book presents a broad overview of the many intersections between health and the environment that lie at the basis of the most crucial environmental health issues, focusing on the responses provided by international and EU law. Consistent with the One Health approach and moving from the relevant international and EU legal frameworks, the book addresses some of the most important issues of environmental health including the traditional, such as pollution of air, water and soil and related food safety issues, as well as new and emerging challenges, like those linked to climate change, antimicrobial resistance and electromagnetic fields. Applying an intersectoral and interdisciplinary approach, it also investigates other branches of international and EU law including human rights law, investment law, trade law, energy law and disaster law. The work also discusses ethics and intergenerational equity. Ultimately, the book assesses the degree of effectiveness of the international and EU normative framework, and the extent to which the relevant legal instruments contribute to the protection of public health from major environmental hazards. The book will be a valuable resource for students, academics and

policy makers working in the areas of Environmental Health law, Global Health law, International law and EU law. This book explores how compliance with international environmental law has changed over time, offering a critical analysis of its current shifting patterns. Beginning with an overview of compliance with international environmental law, the book goes on to explore in detail: compliance in the different legal regimes instituted by Multilateral Environmental Agreements (MEAs), the addition of new subjects of international law, the legal relations between developed and developing countries, and the emergence of new compliance mechanisms in global environmental law. The analysis takes two key developments into consideration: the evolution in forms of compliance and non-state involvement in compliance with international environmental law. In the final section, three case studies are provided to demonstrate how these changes have occurred in selected areas: climate change, biodiversity and water resources. Throughout the book, topics are illustrated with extracts from specific international environmental law jurisprudence and relevant international environmental law instruments. In doing so,

the book offers a comprehensive analysis of compliance with international environmental law, providing original insights and following a clear and systematic structure supported by reference to the sources. This book will be of interest to professionals, academics and students working in the field of compliance with international environmental law.

Situating the global poverty divide as an outgrowth of European imperialism, this book investigates current global divisions on environmental policy. Introduction to International Environmental Law provides a concise overview of international environmental law and the relations and agreements among nations to facilitate environmental protection. Beginning by exploring the history nature and sources of international environmental law, Professor Koivurova moves on to consider the key principles as well as examining the implementation and effectiveness of international environmental law in practice. It considers how international environmental law has developed away from other branches of international law which are heavily based on state sovereignty, in order to more effectively facilitate environmental protection and concludes by posing questions about the

future of the field. Taking a concise, accessible approach throughout and employing case studies drawn from a global range of examples, this book is the ideal first point of entry to the context, principles and issues of this important subject. EU Environmental Law discusses the reality for legal practice throughout the EU, as environmental law of the Member States is becoming ever less 'national'. Consequentially European environmental regulation is becoming more complex and interrelated, making it an emerging field of study for European law graduates, and an area of increasing exposure to the legal profession. This book gives readers a thorough overview of core European environmental law, with a section on the basic framework and principles, as well as on substantive law issues giving insight into the legislation in the different sectors and the most topical developments. This new edition incorporates revised guidance from H.M Treasury which is designed to promote efficient policy development and resource allocation across government through the use of a thorough, long-term and analytically robust approach to the appraisal and evaluation of public service projects before significant funds are committed. It is

the first edition to have been aided by a consultation process in order to ensure the guidance is clearer and more closely tailored to suit the needs of users. In this report, the Law Commission make recommendations for the introduction of a new statutory scheme of conservation covenants in England and Wales. The recommendations to introduce such a scheme would create a new legal tool, enabling landowners to protect land in order to conserve and restore our natural and built environment. Conservation covenants would allow landowners voluntarily to create binding obligations on their own land to meet a conservation objective, such as preserving woodland, cultivating a particular species of plant or protecting a habitat for an animal, or farming land in a certain way. The proposed statutory scheme would give individual landowners the opportunity, using private agreements, to contribute to conservation efforts being made across England and Wales. The scheme will create a versatile, simple and cost-effective legal tool capable of: unlocking currently missed conservation opportunities by overcoming the legal difficulties faced when creating binding obligations; facilitating better ways to deliver existing conservation objectives; and providing assurance of long-

term conservation benefits. The report includes a draft Conservation Covenants Bill, which would introduce the conservation covenant scheme into the law of England and Wales. The first edition of Public Policies for Environmental Protection contributed significantly to the incorporation of economic analysis in the study of environmental policy. Fully revised to account for changes in the institutional, legal, and regulatory framework of environmental policy, the second edition features updated chapters on the EPA and federal regulation, air and water pollution policy, and hazardous and toxic substances. It includes entirely new chapters on market-based environmental policies, global climate change, solid waste, and, for the first time, coverage of the Safe Drinking Water Act. Portney, Stavins, and their contributors provide an invaluable resource for researchers, policymakers, industry professionals, and journalists---anyone who needs up-to-date information on U.S. environmental policy. With their careful explanation of policy alternatives, the authors provide an ideal book for students in courses about environmental economics or environmental politics. This timely Handbook brings innovative, free-thinking and radical

approaches to research methods in environmental law. With a comprehensive approach it brings together key concepts such as sustainability, climate change, activism, education and Actor-Network Theory. It considers how the Anthropocene subjects environmental law to critique, and to the needs of the variety of bodies, human and non-human, that require its protection. This much-needed book provides a theoretically informed analysis of methodological approaches in the discipline, such as constitutional analysis, rights-based approaches, spatial/geographical analysis, immersive methodologies and autoethnography, which will aid in the practical critique and re-imagining of Environmental Law. Environmental Hydraulics is a new text for students and professionals studying advanced topics in river and estuarine systems. The book contains the full range of subjects on open channel flows, including mixing and dispersion, Saint-Venant equations method of characteristics and interactions between flowing water and its surroundings (air entrainment, sediment transport). Following the approach of Hubert Chanson's highly successful undergraduate textbook Hydraulics of Open Channel Flow, the reader is guided step-by-step from the

basic principles to more advanced practical applications. Each section of the book contains many revision exercises, problems and assignments to help the reader test their learning in practical situations. ·Complete text on river and estuarine systems in a single volume ·Step-by-step guide to practical applications ·Many worked examples and exercises This student-friendly textbook offers a survey of the competing conceptions and applications of the increasingly prominent notion of environmental security. The book is divided into three sections. In the first, the key theoretical and practical arguments for and against bringing together environmental and security issues are set out. The book then goes on to present how and why environmental issues have come to be framed in some quarters as ‘national security’ concerns in the context of the effects of overpopulation, resource depletion, climate change and the role of the military as both a cause and a solution to problems of pollution and natural disasters. Finally, the third section explores the case for treating the key issues of environmental change as matters of human security. Overall, the book will provide a clear, systematic and thorough overview of all dimensions of an area of great academic

and 'real-world' political interest but one that has rarely been set out in an accessible textbook format hitherto. This book will be essential reading for students of environmental studies, critical and human security, global governance, development studies, and IR in general. Countries throughout the world have adopted increasingly comprehensive environmental laws over recent years. Even so, immense challenges remain to achieve desired sustainability outcomes. One of the key problems in bridging the gap between legal requirements and sustainability outcomes is deficiencies in compliance and enforcement programs. Compliance and Enforcement of Environmental Law, one of the constituent volumes in the Elgar Encyclopedia of Environmental Law, brings together leading experts to provide a detailed overview of compliance and enforcement tools. The entries are structured around key topics, including: common law causes of action, writing enforceable rules, monitoring and reporting requirements, administrative enforcement, civil judicial enforcement, assessment of civil penalties, and criminal liability. The book also addresses targeting efforts to maximize the value of limited

resources and ways of measuring compliance to help ensure that results are obtained using the relevant tools. These Explanatory Notes relate to the Environment Act 2021 (c. 30) (ISBN 9780105701316) which received Royal Assent on 9 November 2021. This book discusses a broad range of statistical design and analysis methods that are particularly well suited to pollution data. It explains key statistical techniques in easy-to-comprehend terms and uses practical examples, exercises, and case studies to illustrate procedures. Dr. Gilbert begins by discussing a space-time framework for sampling pollutants. He then shows how to use statistical sample survey methods to estimate average and total amounts of pollutants in the environment, and how to determine the number of field samples and measurements to collect for this purpose. Then a broad range of statistical analysis methods are described and illustrated. These include: * determining the number of samples needed to find hot spots * analyzing pollution data that are lognormally distributed * testing for trends over time or space * estimating the magnitude of trends * comparing pollution data from two or more populations. New areas discussed in this sourcebook include statistical techniques for data that are

correlated, reported as less than the measurement detection limit, or obtained from field-composited samples. Nonparametric statistical analysis methods are emphasized since parametric procedures are often not appropriate for pollution data. This book also provides an illustrated comprehensive computer code for nonparametric trend detection and estimation analyses as well as nineteen statistical tables to permit easy application of the discussed statistical techniques. In addition, many publications are cited that deal with the design of pollution studies and the statistical analysis of pollution data. This sourcebook will be a useful tool for applied statisticians, ecologists, radioecologists, hydrologists, biologists, environmental engineers, and other professionals who deal with the collection, analysis, and interpretation of pollution in air, water, and soil. As conservation of the environment plays an increasingly important role within society, Birnie, Boyle, and Redgwell's *International Law and the Environment* continues to be an essential read for students and practitioners alike. Whilst remaining rooted within the substantive law, the book places legislation on the protection of the environment firmly at

the core of the text. Written by experts in the field, the authors employ sharp and thorough analysis of the laws, allowing them to share their extensive knowledge and experience with the reader. The authors provide a unique perspective on the implications of international regulation, promoting a wider understanding of the pertinent issues impacting upon the law. Dated July 2019 As Thomas Sterner points out, the economic 'toolkit' for dealing with environmental problems has become formidable. It includes taxes, charges, permits, deposit-refund systems, labeling, and other information disclosure mechanisms. Though not all these devices are widely used, empirical application has started within some sectors, and we are beginning to see the first systematic efforts at an advanced policy design that takes due account of market-based incentives. Sterner's book encourages more widespread and careful use of economic policy instruments. Intended primarily for application in developing and transitional countries, the book compares the accumulated experiences of the use of economic policy instruments in the U.S. and Europe, as well as in select rich and poor countries in Asia, Africa, and Latin America. Ambitious in scope, the book discusses the

design of instruments that can be employed in a wide range of contexts, including transportation, industrial pollution, water pricing, waste, fisheries, forests, and agriculture. Policy Instruments for Environmental and Natural Resource Management is deeply rooted in economics but also informed by perspectives drawn from political, legal, ecological, and psychological research. Sterner notes that, in addition to meeting requirements for efficiency, the selection and design of policy instruments must satisfy criteria involving equity and political acceptability. He is careful to distinguish between the well-designed plans of policymakers and the resulting behavior of society. A copublication of Resources for the Future, the World Bank, and the Swedish International Development Cooperation Agency (Sida). Inspired by recent litigation, this book identifies and critically appraises the manifold and varied approaches to calculating compensation for damage caused to the environment. It examines a wide range of practice on compensation - in general and specifically for environmental damage - from that of international courts and tribunals, as well as international commissions and regimes, to municipal approaches and other

disciplines such as economics and philosophy. Compensation for Environmental Damage Under International Law synthesises these approaches with a view to identifying their blind spots, bringing clarity to an area where there exists broad discrepancy, and charting best practices that appropriately balance the manifold interests at stake. In particular, it is argued that best practice methodologies should ensure compensation serves to fully repair the environment, reflect the emerging ecosystems approach and any implications environmental damage may have for climate change, as well as take into account relevant equitable considerations. This book is essential reading for academics, practitioners and students working in the field of environmental law.
