Intermediate Filament Cytoskeleton May 24 2020 Intermediate  
filaments are a large family of proteins that are the  
cytoskeletal elements involved in a number of skin, liver,  
neuromuscular, cardiac, eye and hair diseases. Intermediate  
filament genes are regulated in a tissue-and cell type-specific  
manner and their polymerized protein products protects the  
cells and tissue they are part of against a variety of  
mechanical and nonmechanical stresses. This book provides  
a comprehensive resource of methodology essentials,  
describing a variety of essential tools and assays for studying  
intermediate filaments. The book provides user-friendly  
advice and protocols covering all aspects of intermediate  
filaments including protein isolation and structure, protein  
and gene regulation, relationship to disease and apoptosis,  
and associated proteins. Both mammalian and non-  
mammalian systems and animal models are covered, making  
this book a must-have for any investigator wishing to study IF  
genes or their protein products. \* Covers intermediate  
filaments from crystallography, protein chemistry, cell and  
molecular biology, microrheology, gene regulation, to animal  
models and human disease \* Practical and user-friendly with  
detailed "how-to-protocols and "tricks of the trade" \* Includes  
detailed tables of useful reagents, vendors and web links

Neptune and Triton Jan 24 2023 The first reconnaissance of all the major planets of the Solar System culminated in the Voyager 2 encounter with Neptune in August 1989. Neptune itself was revealed as a planet with gigantic active storms in its atmosphere, and off-center magnetic field, and a system of tenuous, lumpy rings. Whereas only two satellites were known prior to the encounter, Voyager discovered six more. Triton, the largest satellite, was revealed as a frozen, icy world with clouds and layers of haze, and with vertical plumes of particles reaching five miles into the thin atmosphere. This latest Space Science Series volume presents the current level of understanding of Neptune, its rings, and its satellites, derived from the data received from the Voyager. The book's chapters are written by the world's leading authorities on various aspects of the Neptune system and are based on papers presented at an international conference held in January 1992. Covering details of Neptune's interior, atmosphere, rings, magnetic fields, and near-space environment--as well as the small satellites and the remarkable moon Triton--this volume is a unique resource for planetary scientists and astronomers requiring a comprehensive analysis of Neptune viewed in the context of

our knowledge of the other giant planets. Until another spacecraft is sent to Neptune, Neptune and Triton will stand as the basic reference on the planet.

Solar System Astrophysics Aug 19 2022 The second edition of Solar System Astrophysics: Planetary Atmospheres and the Outer Solar System provides a timely update of our knowledge of planetary atmospheres and of the bodies of the outer solar system and their analogs in other planetary systems. This volume begins with an expanded treatment of the physics, chemistry, and meteorology of the atmospheres of the Earth, Venus, and Mars, moving on to their magnetospheres and then to a full discussion of the gas and ice giants and their properties. From here, attention switches to the small bodies of the solar system, beginning with the natural satellites. The comets, meteors, meteorites, and asteroids are discussed in order, and the volume concludes with the origin and evolution of our solar system. Finally, a fully revised section on extrasolar planetary systems puts the development of our system in a wider and increasingly well understood galactic context. All of the material is presented within a framework of historical importance. This book and its sister volume, Solar System Astrophysics: Background Science and the Inner Solar system, are pedagogically well written, providing clearly illustrated explanations, for

example, of such topics as the numerical integration of the Adams-Williamson equation, the equations of state in planetary interiors and atmospheres, Maxwell's equations as applied to planetary ionospheres and magnetospheres, and the physics and chemistry of the Habitable Zone in planetary systems. Together, the volumes form a comprehensive text for any university course that aims to deal with all aspects of solar and extra-solar planetary systems. They will appeal separately to the intellectually curious who would like to know how just how far our knowledge of the solar system has progressed in recent years.

Cell Cycle Control Jan 20 2020 The fundamental question of how cells grow and divide has perplexed biologists since the development of the cell theory in the mid-19th century, when

it was recognized by Virchow and others that "all cells come from cells." In recent years, considerable effort has been applied to the identification of the basic molecules and mechanisms that regulate the cell cycle in a number of different organisms. Such studies have led to the elucidation of the central paradigms that underpin eukaryotic cell cycle control, for which Lee Hartwell, Tim Hunt, and Paul Nurse were jointly awarded the Nobel Prize for Medicine and Physiology in 2001 in recognition of their seminal contributions to this field. The importance of understanding the fundamental mechanisms that modulate cell division has been reiterated by relatively recent discoveries of links between cell cycle control and DNA repair, growth, cellular metabolism, development, and cell death. This new phase of integrated cell cycle research provides further challenges and opportunities to the biological and medical worlds in applying these basic concepts to understanding the etiology of cancer and other proliferative diseases.
